A NEW WAY TO MANAGE TIME

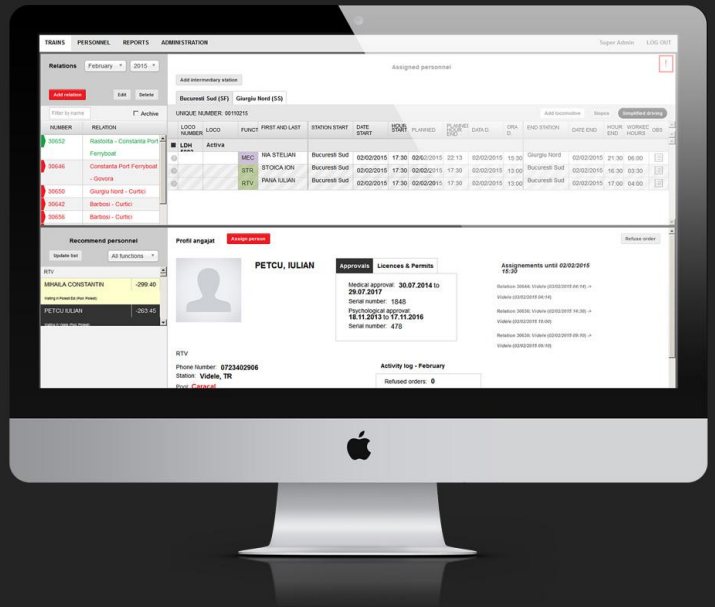
Get a positive Return on Investment in one month by reducing overtime costs through optimized allocation of personnel.

THE CHALLENGE:

Our challenge was that DB Schenker needed to improve the efficiency of personnel allocation to its logistic routes and good transportation. Due to the fact that the resource allocation was made by using old excel files, the system lead to overtime for some employees causing higher payroll costs for the company.

THE SOLUTION:

We defined the business requirements together, and talked with the user group that will use the new solution and decided that the best visual approach will be to build something similar to excel (the system that they were used to work with). We built wireframes in order to create the process and made the platform as a web-based solution set on an open source framework. In order to improve our customer services, we defined reports that were built from the available data. We provided export features for further integration.

CLIENT BENEFITS:


The new application improves efficiency and productivity of the DB Schenker employees, and reduces overall payroll costs by lowering the overtime generated by the previous process. We developed a simple solution in order to help our partners.
